(54) Title: NOVEL STABLE CRYSTAL FORM OF N-TRANS-4-ISOPROPYLCYCLOHEXYL CARBONYL)-D-PHENYLALANINE AND PROCESS OF PREPARATION

(57) Abstract: This invention relates to novel stable crystal form of N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine may be produced by crystallisation of N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine with a solvent at 25 - 38 °C and forming crystals in the solvent. The crystal form may be formed by recrystallisation out of solution. The Crystal form obtained in this way have different melting point, infra red spectrum and X-ray diffraction patterns from previously known forms "B-type" and "H-Type" of the compound.

WO 03/022251 A1

1

FORM 2

THE PATENTS ACT, 1970

(39 of 1970)

COMPLETE SPECIFICATION

1. NOVEL STABLE CRYSTAL FORM OF N- (TRANS-4-ISOPROPYLCYCLOHEXYL CARBONYL)-D-PHENYLALANINE AND PROCESS OF PREPARATION.
2. M/S. ALEMBIC LIMITED, ALEMBIC ROAD, VADODARA – 390 003, GUJARAT, India, an Indian Company incorporated under the Companies Act, 1956.
3. The following specification describes and ascertains the nature of the invention and the manner in which it is to be performed.

FIELD OF THE INVENTION –

The present invention relates to novel stable crystal form of N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine. The Crystals of N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine have different melting point, infrared spectrum and X-ray diffraction patterns from previously known forms, "B-Type" and "H-Type" of the compound.

BACKGROUND OF THE INVENTION

N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine is disclosed in Japanese Patent Application Laid Open No. 63-54321 (equivalent to EP-A-196222 and US 4,816,484) and in J. Med. Chem. 32, 1436-41 (1989). "The Japanese application describes how the compound may be crystallized from aqueous methanol to yield crystals having a melting point of 129⁰ to 130⁰ C. These crystals are in a crystalline form referred to herein as "B-type". An infrared absorption spectrum and powder X-ray diffraction pattern are disclosed in the US patent no. 5463116 Oct. 31 1995".

The U.S. Pat no. 5463116 also describes how the compound may be crystallized from aqueous acetone, ethanol and isopropanol to yield different type of crystals having a melting point of 136⁰ to 142⁰ C. These crystals are in a crystalline form referred to herein as "H-type".

N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine of formula (1) is a known substance having therapeutic utility in depressing blood glucose levels.

(1)

The present inventors have made a novel stable crystalline form of N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine.

The crystals as formed by the present invention hereinafter designated as the "AL-type" crystals of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine are substantially stable to the physical grinding. Such crystals are therefore more suitable for use in medicines than the existing crystals of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine

It is an objective of the present invention to provide a novel stable crystalline form of N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine.

It is a further objective of the present invention to provide a novel method for manufacturing the a stable crystalline new form of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine.

The new form is different than previously known disclosed forms : so called "B-type" and "H-type". The inventors have designated the new stable crystalline form of N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine as "AL-type".

DETAILED DESCRIPTION OF THE INVENTION-

The "AL-type" Crystals of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine may be formed by crystallization from solution, the crystallization from solution taking place at a temperature between 30°C and the boiling point of the solvent.

The crystals thus formed generally comprise enhanced amounts of "AL-type" crystals relative to the starting N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine.

The crystallization at about 30 °C may be performed in several ways as will be apparent to those of skill in the art.-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine "B-type" crystals may be dissolved in a solvent in which it is readily soluble at higher temperature but in which it is only sparingly soluble at lower temperatures.

Solvents which are suitable for use in this invention may be selected from the group comprising dimethyl formamide, dimethylacetamide and acetonitrile.

More preferably the solvent is acetonitrile.

The dissolution volume of the solvent is preferably from 8 to 60 vol % of the solvent.

The temperature of the solution is preferably 55⁰ C to 75⁰ C.

The new crystals were obtained from the solution by filtration or centrifuging and then dried at a temperature in the range 50⁰ C to 90⁰ C

BRIEF DESCRIPTION OF THE ANNEXURES INCLUDING DRAWINGS

FIGURE 4 :: Shows a crystals photograph of "AL-type" form of N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine in accordance with the present invention.

FIGURE. 5 :: Shows a crystals photograph of "H-type" form of N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine.

FIGURE 6 :: Shows a crystals photograph of "B-type" form of N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine.

DESCRIPTION OF THE PREFERRED EMBODIMENTS

The present invention provides a stable "AL- type" crystalline form of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine. The various examples of the physical properties of the "AL-type" crystal form of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine are as follows.

The inventors have measured the melting point of new "AL-type" crystals of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine and found it to be in the range of 174⁰ to 178⁰ C.

Similarly , when the melting points of both the previously known " B-type" & " H-type" crystals were taken by same technique, melting points were found 127⁰ to 130⁰ C and 136⁰ to 140⁰ C. respectively.

The powder X-ray diffraction patterns of new " AL-type" crystals of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine as shown in Anex-2 is obtained by using a Philips PW1700 powder diffractometer and a scan speed of 0.05.degree./sec. The observed powder X-ray diffraction patterns of new " AL-type" crystals is different than the disclosed X-ray diffraction patterns in patent

US 5463116 for "B-type" & "H-type" crystals of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine.

The inventors carried out the CHN analysis of all three "B-type", "H-type" and "AL-type" crystals of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine and the results are shown as below.

| Molecular Formula :: C ₁₉ H ₂₇ N O ₃ | | | |
|---|-------|------|------|
| | C % | H % | N % |
| Theoretical Value | 71.89 | 8.57 | 4.41 |
| Observed Value for "AL-type" | 71.75 | 8.76 | 4.09 |
| Observed Value for "H-type" | 71.92 | 8.44 | 4.41 |
| Observed Value for "B-type" | 71.92 | 8.96 | 4.17 |

These results confirm that the all three "B-type", "H-type" and new "AL-type" crystals of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine have the similar composition.

The new "AL-type" crystals of N-(trans-4- isopropylcyclohexyl carbonyl)-D-phenylalanine are preferably substantially stable to the physical grinding. Stability to grinding may be assessed by measurement of physical property before and after grinding. Where the physical property remains substantially unchanged. Suitable physical properties for measurement includes melting point, differential scanning calorimeter and infra red absorption spectrum.

The photographs as shown in Anex - 4 - 6 of all three " AL-type", "H-type" and "B-type", crystals of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine were taken by using a Phillips XL-30 electron microscope. The crystal shape of new " AL-type" crystals is substantially different than the other known both " B-type" & " H-type" crystals of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine.

The " AL-type" Crystals of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine may be formed by crystallization from solution, the crystallization from solution taking place at a temperature between 30⁰C and the boiling point of the solvent. The crystals thus formed generally comprise enhanced amounts of " AL-type" crystals relative to the starting N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine.

The crystallization at about 30 °C may be performed in several ways as will be apparent to those of skill in the art.-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine " B-type" crystals may be dissolved in a solvent in which it is readily soluble at higher temperature but in which it is only sparingly soluble at lower temperatures. Solvents which are suitable for use in this invention include dimethyl formamide, dimethylacetamide and acetonitrile. . A preferred solvent is acetonitrile. The dissolution volume of the solvent is preferably from 8 to 60 vol % of the solvent. The temperature of the solution is preferably 55° C to 75°C. The new crystals were obtained from the solution by filtration or centrifuging and then dried at a temperature in the range 50° C to 90°C.

The invention will now be more concretely illustrated by the following examples but the invention may not be construed to be limited thereto.

EXAMPLES

N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine for use in the following examples was obtained by the method described in Example 3 of Japanese patent application laid open no. 63-54321. The product consists of crystals of "B-type".

Example-1

A solution of 10 g of N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine " B-type " in 120 ml of an acetonitrile is stirred at 55 – 60° C. After cooling to 30 - 35° C., the precipitated crystals were filtered and dried at 70-80° C. at reduced pressure overnight. 3.5 g of dry crystals were obtained. The crystals had a melting point of 174° to 178° C. The powder X-ray diffraction pattern and the infra-red absorption spectrum were measured and the crystals were identified as "AL-type", and the required analytical tests are carried { NMR, I.R., XRD, DSC, as depicted in the annexures }, by which it can be concluded that the novel crystal formed are stable. The formed crystals are "AL-type". "AL-type

Example- 2

N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine " B-type " (5 g) was dissolved in acetonitrile 60 ml. at 55 - 60° C. The solution was cooled with stirring. "AL-type" crystal form of N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine (0.1 g) prepared in Example 1 were added at a temperature of 30 - 38° C and the solution was cooled further to 25° C. The crystals were filtered and dried at 70-80° C. overnight and at reduced pressure. 1.5 g of dry crystals were obtained. The crystals had a melting-point of 174° to 178° C. The powder X-ray diffraction pattern and the infra-red absorption spectrum enabled the crystals to be identified as "AL-type".

We claim-

1. An isolated novel stable crystal form of N-(trans-4-isopropylcyclo hexyl carbonyl)-D-phenylalanine having the following physical properties:
 - (a) A melting point in the range of 174° - 178° C. Anex.-1.
 - (b) A powder X-ray diffraction pattern with reflection maxima at 2.theta. of about 7.5.0., 15.5.0., 19.8.0. and 20.2.0.; Anex.-2.
 - (c) An infra red absorption spectrum with critical absorption bands in the region of 1711.5, 1646.5, 1538.7, 1238.8, 1215.1 and 700.5 cm. Anex.-3.
2. An isolated novel stable crystal form of N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine having an X-ray powder diffraction pattern as shown in Anex.-2. and an infra red spectrum as shown in Anex.-3.
3. Novel stable crystal form of N-(trans-4-isopropylcyclohexyl carbonyl)-D-phenylalanine according to any one of claims 1 and 2 being substantially free of solvent.
4. A process for preparing the novel stable crystal form of N-(trans-4-isopropylcyclo hexylcarbonyl)-D-phenylalanine which comprises dissolving N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine in a solvent in which it is soluble at a temperature greater than 60° C to form a solution, crystallizing the said solution by cooling to a temperature of 28° C or higher, and obtaining the desired crystals at a temperature in excess of 28° C.

5. A process as claimed in claim 4 wherein N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine is dissolved in the solvent at a temperature between 60°C to 75°C.
6. A process as claimed in claim 4 wherein the precipitation of the solution is carried out at a temperature between 28°C to 35 °C.
7. The process as claimed in claim 4 wherein the said crystals are separated from the solvent at a temperature of 38°C.
8. The process as claimed in claims 4 and 5 wherein the solvent is a water miscible polar solvents, selected from the group comprising acetonitrile, dimethyl formamide and dimethyl acetamide.
9. The process as claimed in claim 4 and 8 wherein the water miscible polar solvent is acetonitrile.
10. The process as claimed in claim 4 wherein the concentration of the said solvent is from 8 to 20 vol % of the product.
11. An isolated novel stable crystal form of N-(trans-4-isopropylcyclo hexyl carbonyl)-D-phenylalanine substantially as herein described with reference to the foregoing description and the accompanying examples.

12.A process for preparing the novel stable crystal form of N-(trans-4-isopropylcyclohexylcarbonyl)-D-phenylalanine substantially as herein described with reference to the foregoing description and the accompanying examples.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/IB01/02080

Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claim Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☐ Claim Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☒ Claim Nos.: 9
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.
